## ABSTRACT

This study examines how scholarly research on consumer brand relationships has evolved over the last decades by conducting a bibliometric citation meta-analysis. The bibliography was compiled using the *ISI Web of Science* database. The literature review includes 392 papers by 685 authors in 101 journals. The area of consumer brand relationships research is notably interdisciplinary, with articles mainly published in journals for business and management, but also applied psychology and communication. We show the impact of universities, authors, journals, and key articles and outline possible future research avenues. The study explores seven sub-research streams and visualizes how articles on consumer brand relationships build on each other using co-citation mapping technique. Based on the results of this analysis we propose an agenda for future research that offers the potential to advance research on the relationships between consumers and brands.

## 1. Introduction

In the last two decades the number of articles examining consumer brand relationships (CBR) has increased rapidly, thus reflecting the tremendous popularity of this research area in the literature. The beginning of this research area is marked in the mid 1990s. Blackstone's book chapter in 1993, "Beyond Brand Personality: Building Brand Relationships," and later Fajer and Schouten's (1995) paper, "Breakdown and Dissolution of Person–Brand Relationships," already discussed the relationships of consumers and brands, but it was not until Fournier's (1998) seminal article which provides a theoretical foundation and explanation for consumer brand relationships research. While there were very few papers written prior 1998, they either did not specifically focus on consumer brand relationships (e.g., Fournier & Yao, 1997) or were book chapters similar to the one by Blackstone (1993) or Heilbrunn (1998), and therefore did not get as frequently distributed and thus attention in academia compared to journal articles. Moreover, and equally important, a bibliometric analysis is based on citations and thus any uncovered but important paper published prior 1998 would still be considered and

identified in our analysis. For these reasons we chose Fournier's (1998) work as a starting point for a meta analytic review.

Since 1998 a variety of different perspectives, concepts, models and various theories have been developed and introduced to understand consumers' relationships to their brands, including research on self-brand connections (Escalas & Bettman, 2005), brands in the self-concept (Hamilton & Hassan, 2010; Sprott, Czellar, & Spangenberg, 2009), brand attachment (Belaid & Behi, 2011; Malär, Krohmer, Hoyer, & Nyffenegger, 2011; Park, MacInnis, Priester, Eisengerich, & Iacobucci, 2010; Thomson, MacInnis, & Park, 2005), brand passion (Albert, Merunka, & Valette-Florence, 2012; Bauer, Heinrich, & Martin, 2007), brand romance (Patwardhan & Balasubramanian, 2011), brand relationship orientation (Aurier & Lanauze, 2012), brand commitment (Walsh, Winterich, & Mittal, 2010), or brand love (Albert, Merunka, & Valette-Florence, 2008; Batra, Ahuvia, & Bagozzi, 2012; Carroll & Ahuvia, 2006; Fetscherin, Boulanger, Filho, & Souki, 2014; Heinrich, Albrecht, & Bauer, 2012) to name just a few. The published articles distinguish various intensities and types of emotions and hence relationships consumers can have with brands (Carroll & Ahuvia, 2006). However, a clear understanding of how all these different concepts relate to or built on each other is still missing in academic literature.

While frequently new concepts and constructs are introduced to literature to explore and explain consumer brand relationships (e.g., brand authenticity, brand evangelism, brand extreme desire, or brand fanaticism among others) surprisingly little attention has been spent so far on examining the whole existing work and reflecting how research has evolved and shaped the research area of consumer brand relationships so far. "Since research can be cyclical (Daniels, 1991),

<sup>☆</sup> The authors thank Noël Albert for his helpful comments on an earlier draft. Thanks also to the anonymous reviewers for their valuable feedback and suggestions that improved the article. Special thanks go to Patrick J. Neumann for his assistance throughout the publication process.

one needs to take an occasional step back" (Fetscherin & Usunier, 2012, p. 733) and analyze existing consumer brand relationships literature. Our work seeks to fill this gap by conducting a literature review by means of a bibliometric author co-citation meta-analysis of articles related to consumer brand relationship research.

This longitudinal approach is valuable as consumer brand relationships are based on a wide range of theories and concepts from multiple disciplines. Due to the complex nature of this research area, we conducted an interdisciplinary review of the literature that addresses three main research questions. (1) How has consumer brand relationship research evolved in the past, what are the underlying research streams, and which need further attention? (2) Which journals, articles, and authors are the most cited ones and therefore worth reading for future research in this field? (3) Which institutions (as defined by universities) are the most influential ones, and thus contribute most to the area of consumer brand relationships?

In that respect, our analysis makes an important contribution for scholars interested in consumer brand relationships because we outline, structure, and identify the key universities, journals, articles and authors to be taken into consideration when conducting future research on consumer brand relationships. We also provide a valuable overview of the research history, and synthesize and identify established and also emerging research streams. In that respect, we provide a quick reference guide for interdisciplinary researchers, business consultants, and marketers who want to become familiar with the topic of consumers and their relationships to brands. The later of this paper is structured as followed: next we introduce the concept and method of bibliometric citation meta-analysis. Then we present detailed results of the empirical analysis. Following that, we describe structure and streams of consumer brand relationship research and finally conclude with limitations and implications for future research.

## 2. Bibliometric citation meta-analysis

Bibliometric citation analysis is a well-established form of meta-analytical research or a so called "meta-review" of literature (Cote, Leong, & Cote, 1991; Garfield, 1983; Harsanyi, 1993; Kim & McMillan, 2008). It was initially used in different disciplines in science and the humanities (Price, 1976; White & McCain, 1989; Wiberley, 2003). Later it has also been applied in the social science disciplines (Glanzel, 1996) such as international business (Fetscherin, Voss, & Gugler, 2010), international management (Acedo & Casillas, 2005), marketing (Arnott, 2007), advertising (Kim & McMillan, 2008) and communications (Pasadeos, Renfro, & Hanily, 1999). Bibliometric analysis unveils pivotal articles and objectively illustrates the linkages between and among articles about a certain research topic or filed by analyzing how many times they have been co-cited by other published articles (Fetscherin & Usunier, 2012). Data from these analyses are useful not only to measure popularity but also the impact of specific authors and their publications. Consequently, bibliometric citation analysis allows evaluating meta-analytically the development of a given research area or discipline as well as it helps to identify key research streams and their underlying theoretical frameworks (Borgman, 2000; Vassinen, 2006).

"Bibliometric analysis is based on the assumption that researchers publish their most important findings in scholarly journals and predominantly base their research on articles previously published in similar journals (Van Raan, 2003), a reasonable assumption" (Fetscherin & Usunier, 2012, p. 735) which is also applicable for branding research (Chabowski, Samiee, & Hult, 2013). "Citation analysis considers a citation to be the basic unit of analysis (Kim & McMillan, 2008) and therefore goes beyond a simple counting of publications to include centers of influence" (Fetscherin & Usunier, 2012, p. 735) and maps out the linkages between and among articles of a research field (Kim & McMillan, 2008). Consequently, an analysis of citations reflects the usefulness of

research to other researchers conducting related work (Garfield, 1983). As the focus of our study is to shed light on the research stream of consumer brand relationships, bibliometric citation analysis is an appropriate meta-analytic approach to reach the three outlined goals.

## 3. Method

Citation data are available for a wide range of publications. For this study we collected data from the most well-known academic database *ISI Web of Knowledge* called also *Web of Science* which includes the *Social Sciences Citation Index* (SSCI). "The *ISI Web of Knowledge* was suitable for this as one of the main objectives is to conduct an interdisciplinary literature review and many notable bibliometric studies have used this database before" (Fetscherin & Usunier, 2012, p. 735). We searched for publications that appeared from January 1998 to October 2010. The year 1998 was chosen as the cut-off year as it was the year Fournier (1998) wrote the seminal work, "Consumers and their brands: developing relationship theory in consumer research" which we choose as the jump start for the consumer brand relationship research field as discussed earlier. October 2010 marked the most recent date for which we got complete citation data from the *ISI Web of Knowledge*.

To collect comprehensive data, we used a two-step approach. First, we identified articles that had referenced Fournier's (1998) work. Second, for each relevant article we recorded author name(s), the journal it is published in, "title, volume, number, pages, publication date, abstracts, and cited references. Inspired by the work of Roper and Parker (2006), we used bibliometric software to facilitate the process of identifying the citation and co-citation relationships of articles. We chose to use *HistCite™* software which is a specific bibliometric software tool for analyzing and visualizing citation linkages between scientific papers" (Fetscherin & Usunier, 2012, p. 736). Direct citation linkages are articles that are cited by a paper in their reference. Indirect citation linkages are those citations which are not in the original paper cited, but are citations of citations. In other words, publication A cites publication B and publication B cites publication C but publication A does not cite publication C. In this case we have a direct citation link between A and B as well as B and C and an indirect citation link between A and C. The software's "inputs are bibliographic records (with cited references) from *ISI Web of Knowledge* and outputs are various tables and graphs with indicators about the knowledge domain under study" (Fetscherin & Usunier, 2012, p. 736).

## 4. Results

This section presents the results of the bibliometric citation analysis including an evaluation of which institutions (as defined by universities) are leading with regard to articles published in the field of consumer brand relationships. Moreover it provides an evaluation of highly cited published articles and journals, and thus allows us to introduce a research agenda in the following section. To start with, we identified 392 articles in total which referred to Fournier's (1998) work on consumer brand relationships. On closer examination the key disciplines of those 392 articles are business (61%), management (16%), applied psychology (9%), communications (4%) and hospitality, as well as leisure, sports, and tourism (3%) research. This finding reflects the interdisciplinarity of the research area on a first glance. However, with regard to our main research questions we compute a set of statistics, rankings, and tables we are outlining in the following.

### 4.1. Centers of excellence

In order to identify centers of excellence in research on consumer brand relationships, we measure the importance and academic weight of different institutions (on the aggregate level of universities) by their output measured by the total number of published articles related

to consumer brand relationship research ( $P_{CBR}$ ) and impact in terms of citation received. In the following, we provide two scores for citation received. First, the total local citation (TLC) score represents the total number of times a paper has been cited by other papers from the retrieved sample (i.e., in our case the 392 articles). Second, the total global citation (TGC) score is the total number of times a paper has been cited based on the full *ISI Web of Knowledge* count. Currently over 46 million records across all sciences are available in the database ([www.thomsonreuters.com](http://www.thomsonreuters.com)). This approach is similar to the one in the study of Carpenter et al. (1988), Moed, Burger, Frankfort, and Van Raan (1985) or Van Raan (2008) and thus a well-established procedure.

Our results show a diversity of institutions which lead this research field. The most influential institutions are located in the USA and UK, and some in Canada, Australia, Netherlands, France and Germany. Most influential researchers are from diverse institutions such as (alphabetical order): Boston College, Boston University, Columbia University, University of Connecticut, Ohio State University, University of Minnesota, University of Illinois, and University of Wisconsin among others. Table 1 provides an overview of the most influential institutions involved in research on consumer brand relationships in terms of number of published articles related to consumer brand relationships (left side of the table) as well as number of overall citation received from their publications (right side of Table 1). These institutions are viewable as “centers of excellence” for consumer brand relationship research in the past. This helps academics (e.g., Ph.D.-students, post-docs or those on the job market) to target institutions for potential collaboration or employment.

4.2. Most influential journals

Researchers use bibliometric citation analysis to assess journal performance, including studies by Reeves and Borgman (1983) and Schubert, Glanzel, and Braun (1989). As Baumgartner and Pieters (2003) noted, “different journals are most influential in different sub-areas” (p. 123) we want to identify which journals “shape” and “lead” the field of consumer brand relationships. Table 2 summarizes the top 20 journals in terms of total number of articles published related to CBR ( $P_{CBR}$ ) and impact measured on one hand by the average number of local citations received within the 392 retrieved articles per year (TLC/t) and the average number of citations received from all articles, respectively total global citations received per year (TGC/t).

Overall, marketing journals, especially those with a focus on consumer research (e.g. *Journal of Consumer Research* and *Advances in Consumer Research*) and psychology (e.g. *Psychology & Marketing* and *Journal of Consumer Psychology*) dominate the lists of the most influential journals in the field of consumer brand relationships next to a few other top tier marketing journals like *Journal of Marketing* or *Journal of Marketing Research*. Moreover, the top tier ranking comprehends also

Note:  
 $P_{CBR}$  number of articles published related to consumer brand relationships  
 TLC/t average local citations received per year  
 TGC/t average global citations received per year.  
<sup>a</sup> Ordered by numbers of published articles related to CBR [ $P_{CBR}$ ].

journals with a more holistic focus in general, like the *Journal of Business Research*.

To investigate the results further, we take the number of articles published as a proxy of output, and the total local citations received per year (TLC/t) as a proxy for the impact on the field of consumer brand relationships. Fig. 1 illustrates a  $2 \times 2$  matrix where the x-axis represents the total local citation received by year (TLC/t) and the y-axis represents the number of articles published by each journal related to consumer brand relationships ( $P_{CBR}$ ). By calculating and evaluating the mean values of both variables ( $P_{CBR} M = 4.04$ ;  $TLC/t M = 1.26$ ), four main groups of journals can be distinguished: quadrant A: high focus on the consumer brand relationship field and high impact; quadrant B: low focus on the consumer brand relationship field and high impact; quadrant C: low focus on the consumer brand relationship field and low impact; and quadrant D: high focus on the consumer brand relationship field and low impact. From 97 journals in our dataset, 87 journals are in quadrants B, C, and D, meaning below the average output ( $P_{CBR} M = 4.04$ ) and/or below the average impact ( $TLC/t M = 1.26$ ). There are only 10 journals which are located in quadrant A, meaning above average output and impact. There are 12 journals which have above average impact (quadrants A and B) and 18 journals which have above average output (quadrants C and D). For illustrative purposes,

Fig. 1. Journal focus and impact on CBR research (big picture).

Fig. 1 provides a broad illustration of the 4 identified main group quadrants, respectively. This figure shows the findings at a first glance. The purpose of this “big picture map” is also to shed light on the distances regarding the journals’ impact and focus on consumer brand relationship research. For illustrative purposes and to give more details to the reader, we also constructed Fig. 2 which shows the details for those journals which are in quadrants B, C and D and thus are located on the low end of the axes of coordinates.

Besides the ranked journals (c.f. Table 2, Figs. 1 and 2) quite a number of other journals contribute to the field of consumer brand relationship research, like the *Journal of Brand Management* or the *Journal of Product and Brand Management* which have recently published work in this domain. Though, the focus of our bibliometric citation meta-analysis was not to identify every single outlet for articles dealing with research on consumer brand relationships but to assess the most influential journals. Hence, future research could investigate this phenomenon more in detail. However, to address our next research question a closer look on how influential single articles are is necessary. The corresponding examination is reported in the following paragraph.

#### 4.3. Most influential articles and trending papers

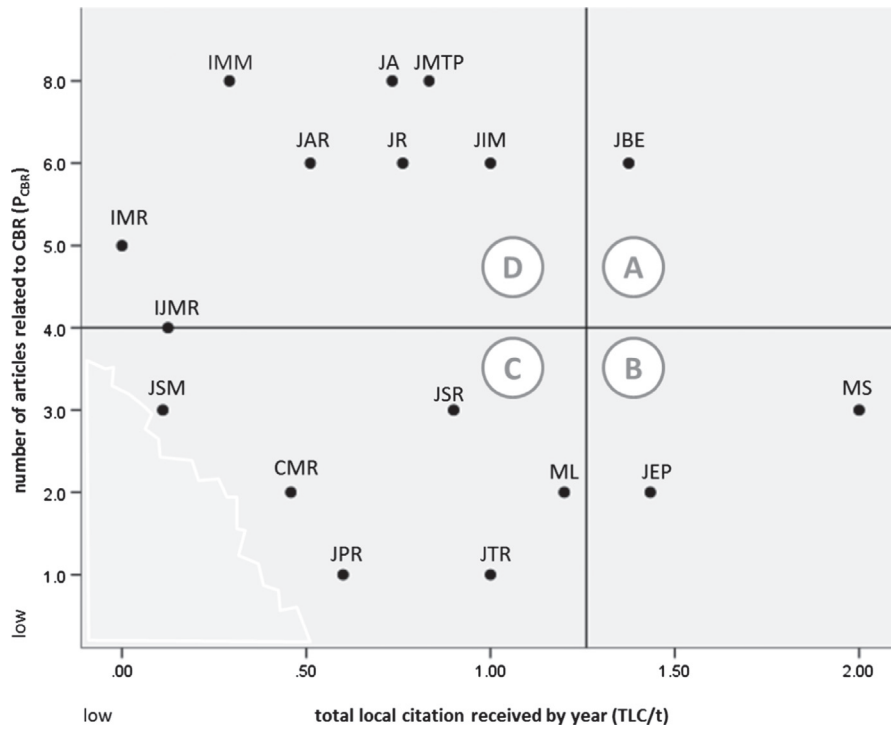

To address the question of which articles and authors are the most cited and thus impactful in the field of consumer brand relationship research, a multistep procedure was operated. The results of this procedure appear in Table 3. This table shows the total citations received within the (local) retrieved articles (TLC), the total local citations received per year (TLC/t), the total global citations received (TGC),

and the corresponding yearly average (TGC/t). A closer look on the ranking uncovers that all articles listed can be considered highly influential in shaping the research field of consumer brand relationships. However, please note that some articles are broad literature reviews (e.g., Arnould & Thompson, 2005; Oliver, 1999) and are therefore in the narrow sense not part of consumer brand relationship research but contribute in a broader sense to the field. While such papers do not focus specifically on CBR, they still provide foundations and contributions to the CBR field or relate to consumer brand relationships. This conclusion exemplifies again the multidisciplinary of the research area of consumer brand relationships.

Identifying the roots and fundamentals of consumer brand relationships research and uncovering up-and-coming papers are valuable actions. The identification of those trending articles is a next step in our analysis in order to provide insights on not only where consumer brand relationships came from but also where it is heading to. For this purpose we compute the ratio of local citations in the ending (LCSe). This ratio shows whether an article acquired more citations at the end of the time period studied. This allows us to assess not only which papers have been cited over a fixed period of time studied but also if those papers have been cited more recently allowing to identify emerging topics. Table 4 ranks articles in descending values for LCSe thus reflecting trending papers. The next paragraph discusses the content of the research area in more detail and discusses future research avenues.

#### 5. Citation mapping

We used a co-citation mapping technique to visualize how articles on consumer brand relationships are co-cited and cited reciprocally

Note: As there are 87 journals are in quadrant B, C, and D, for illustrative and readability purposes we only show those journals which have at least either 2 articles published between 1998 and 2010 or at least an average citation per year of 0.25.

Fig. 2. Journal focus and impact on CBR research (detailed view).

over time. This technique enables us to identify the broader group of articles published and helps to uncover groups of themes or research streams. This procedure helps to examine the origin and direction of future research (Small, 1999). "To get meaningful results and to visualize co-citation networks among articles, our analysis has been limited to those articles which have been cited" (Fetscherin & Usunier, 2012, p. 740) at least five times since 1998 (TLC > 5). In fact, we did look at competing models with TLC > 1, TLC > 2, TLC > 3 and TLC > 4 but the results of these alternative analyses were the same as they outlined, just with different level of details in terms of number of articles, the main research streams. As we aim to identify the core structure or the 'skeleton' behind

consumer brand relationship research, we choose the threshold of TLC > 5 as cutoff criteria. Other studies have also used similar thresholds (e.g. Fetscherin & Usunier, 2012) and this also allows us to focus on the most important articles. This leaves us with the 42 most cited articles out of the total number of 392 analyzed papers, representing roughly 10% of the most influential work. In Fig. 3, the vertical axis represents the year of publication. Each article represents a node and the size of each node circle depends on the number of total local citations received where the bigger the circle the more citations received and the more influential this work. "An arrow pointing from one node to another indicates a citation relationship between papers that is, the paper from which the arrow originates cites the paper the arrow points to" (Fetscherin & Usunier, 2012, p. 740).

In order to explore research streams, this process was also facilitated by using HistCite™, a specialized bibliometric software. Next, we conduct a content analysis of those papers and identified seven distinct but interrelated research streams on consumer brand relationship research as outlined in Fig. 3. These are: (1) the study of the relationships between various consumer brand relationships constructs such as brand satisfaction, brand loyalty, brand trust, brand attachment, brand commitment, and brand personality; (2) effects of consumer brand relationships on consumer behavior and attitude; (3) brand love; (4) brand communities; (5) brand cult and brand relationships and culture; (6) self-brand-connections like self-congruence, self-presentation, and reference group; and finally (7) storytelling and brand relationships. We will discuss each stream by giving the key articles and topics discussed. Moreover we describe how these streams develop and point out their relevance for future research by also highlighting articles that contribute to the identified streams but have only been published recently. Each of the 392 paper has a unique ID. This number is the ID number and refers to the number provided in Fig. 3.

5.1. Relationships between various consumer brand relationships constructs

The first group of papers studies the relationships between various branding concepts. As a theoretical basis those articles often refer and build on to various theories ranging from psychology, anthropology, sociology or neuroscience. Social exchange theory (Thibaut & Kelley, 1978), interdependence theory, and investment theory (Rusbult, 1983) provide a rich avenue for explaining brand loyalty. In addition,

behavioral science theories like risk theory and theory of cognitive dissonance (Festinger, 1957) help to explain why consumers build relationships with brands and how brand satisfaction and trust are evoked (Vesel & Zabkar, 2010). The most influential articles are those from Oliver (1999), number eight in Fig. 3, who analyzes the relationship between brand satisfaction and brand loyalty. "To explain the satisfaction–loyalty conundrum the author investigates what aspect of the consumer satisfaction response has implications for loyalty and what portion of the loyalty response is due to this satisfaction component. The analysis

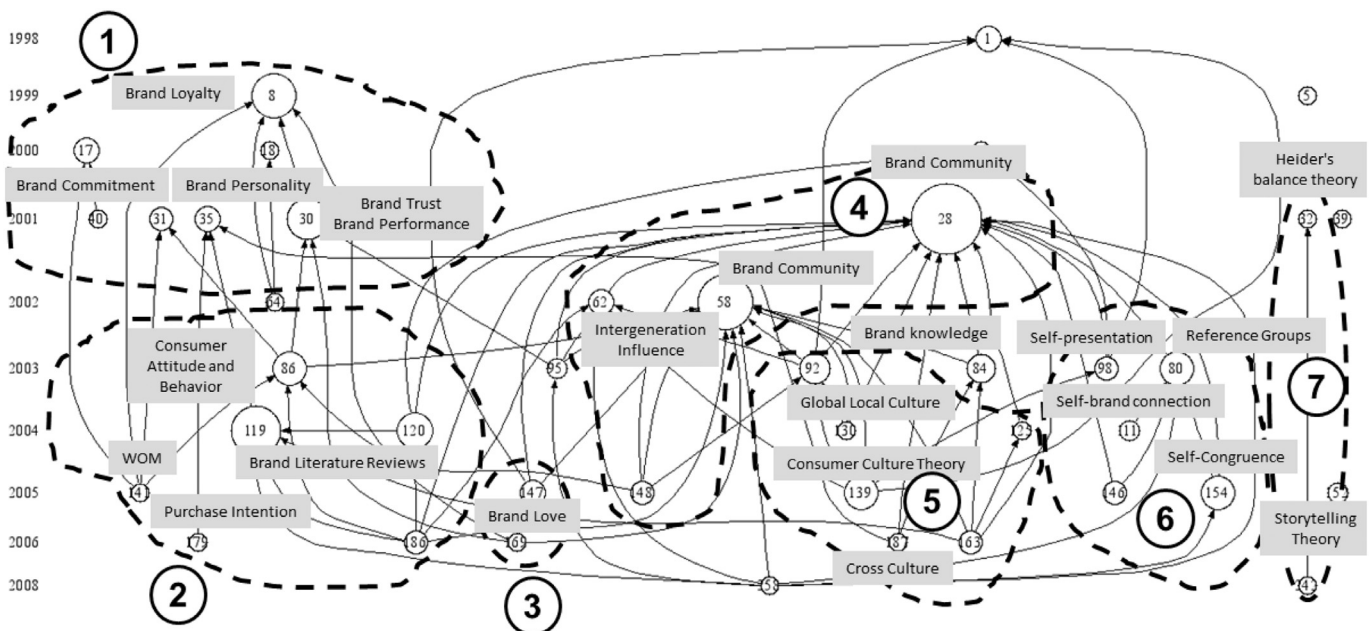

Fig. 3. Consumer brand relationships citation mapping.

concludes that satisfaction is a necessary step in loyalty formation but becomes less significant as loyalty begins to set through other mechanisms" (Oliver, 1999, p. 33). Chaudhuri and Holbrook (2001) (30 in Fig. 3) examine two aspects of brand loyalty, attitudinal and purchase loyalty which link brand trust to brand affect and brand performance. Related to brand trust, Elliott and Yannopoulou (2007) (190 in Fig. 3) developed a psychosocial model of trust in brands based on social theory and psychology of human relationships. Brand commitment research is dominated by Ahluwalia, Burnkrant, and Unnava (2000) (17 in Fig. 3) and shows how consumers process negative information about the brands they like. Brand commitment of the consumer towards the brand moderates negative information effects. Later Ahluwalia, Unnava, and Burnkrant (2001, p. 458) (40 in Fig. 3) find that "when consumers are not familiar with a brand, negative information spills over to attributes that are associated with the target attribute but not mentioned in the message". However, positive information does not differ, which means that when consumers like the brand, a spillover occurs for the positive information as well. Since those similar work emerged, multiple studies dealt with brand commitment such as Zhou, Zhang, Su, and Zhou (2012) who identify brand attachment as an antecedent of brand commitment or Veloutsou and Moutinho (2009) exploring brand commitment on the strength of consumer brand relationships as well as longtime reputation of the brand. Finally, another key article is the one from Caprara, Barbaranelli, and Guido (2001) (35 in Fig. 3) which examines to what extent, in a consumer setting, are human personality and brand personality related.

This research stream emphasizes that these concepts are related or interrelated. Consumer brand relationship research is complex and multi-dimensional and therefore researchers and practitioners need to look at brand relationships as a holistic construct rather than an atomistic one. This perspective suggests that when designing future studies, one needs to study not just the relationship between one construct and another but consider multiple constructs and assess how they all relate and interact. In line with this argument, a continuation of this research stream shows the most recent work by Belaid and Behi (2011) who examined the role of and its links with constructs such as brand satisfaction, brand commitment, brand trust and brand loyalty. Similarly, Sahin, Zehir, and Kitapçı (2011) show that brand experiences, brand satisfaction, and brand trust positively affect brand loyalty and Keller (2012, p. 186) argues that, "any concept as complex as brand relationships lends itself to multiple concepts, perspectives, and analysis." Schmitt (2012, p. 7) presents a consumer-psychology model which "distinguishes three levels of consumer engagement (object-centered, self-centered and social) and five processes (identifying, experiencing, integrating, signifying and connecting)" and illustrates how brand relationship research is connected with other constructs. Notably, Eisend and Stokburger-Sauer (2013) scrutinize antecedents and consequences of the brand personality construct (Aaker, 1997) by the help of a meta-analytic review. Their results provide novel insights for future investigations.

## 5.2. Consumer behavior and attitude

This research stream assesses the effects of consumer brand relationships on consumer attitude or consumer behavior. It is dominated by the works of Bhattacharya and Sen (2003, p. 76) (86 in Fig. 3) where they "determine why and under what conditions consumers enter into strong, committed, and meaningful relationships with certain companies, becoming champions of these companies and their products. Drawing on theories of social identity and organizational identification, the authors propose that strong consumer–company relationships result from consumers' identification with those companies". Aaker, Fournier, and Brasel (2004, p. 1) (119 in Fig. 3) report "results from a longitudinal field experiment examining the evolution of consumer brand relationships. Development patterns differed, whereby relationships with sincere brands deepened over time in line with

friendship templates, and relationships with exciting brands evinced a trajectory characteristic of short-lived flings". Aggarwal (2004, p. 87) (120 in Fig. 3) finds "that when consumers form relationships with brands, they use norms of interpersonal relationships as a guide in their brand assessments. Two relationship types are examined: exchange relationships in which benefits are given to others to get something back and communal relationships in which benefits are given to show concern for other's needs".

This research stream assesses more the contextual questions related to consumer brand relationships such as *who*, *when*, *why* and *how* consumers enter relationships with brands. One recent article by Alba and Lutz (2013) is an extension of this research stream and presents an Attachment–Aversion (AA) relationship model and discusses the scope of brand relationship research by presenting a typology of AA relationships.

## 5.3. Brand love

Another strong research stream which emerged is the one about consumers' brand love. It is dominated by the work from Ahuvia (2005, p. 171) (147 in Fig. 3) who "investigates the possessions and activities that consumers love and their role in the construction of a coherent identity narrative". Ahuvia demonstrates the role and importance of beloved objects and activities in structuring social relationships with brands. Later, Carroll and Ahuvia (2006) (169 in Fig. 3) test hypotheses in a structural equation model embedding brand love that assesses satisfied consumers' passionate emotional attachment to particular brands. Brand love is greater for brands in product categories perceived as more hedonic versus utilitarian products and for brands offering symbolic benefits.

This research stream also focuses on extreme emotions (positive and negative) consumers can have for brands. Since Ahuvia's (2005) paper, multiple studies dealt with the brand love construct (e.g., Ahuvia, Batra, & Bagozzi, 2008; Albert et al., 2008; Batra et al., 2012; Heinrich et al., 2012) or similar constructs such as brand passion (Bauer et al., 2007; Swimberghe, Astakhova, & Wooldridge, in press) as well as extreme negative emotions such as anti-branding (Krishnamurthy & Kucuk, 2009) or brand divorce (Sussan, Hall, & Meamber, 2012). Specifically extreme negative emotions or the 'dark-side' of consumer brand relationships need further investigations and should be research priorities for the next years in the area of consumer brand relationships.

## 5.4. Brand communities

This research stream is one of the largest and oldest. Different articles dominate this stream. For the beginning, Muñiz and O'Guinn (2001) (28 in Fig. 3) introduce the concept and framework of brand communities. "Grounded in both classic and contemporary sociology and consumer behavior, this article uses ethnographic and computer mediated environment data to explore the characteristics, processes, and particularities of three different brand communities (Muñiz & O'Guinn, 2001, p. 112). Later, McAlexander, Schouten, and Koenig (2002) (58 in Fig. 3) analyze brand communities from a customer-experiential perspective. Crucial relationships include those between the customer–brand, customer–company, customer–product in use, and customer–customer. The authors expand the definition of a brand community and argue the importance of the social context and that brand communities are dynamic, rather than static phenomena. Moore, Wilkie, and Lutz (2002) (62 in Fig. 3) look at intergenerational influence on brand relationships. They assessed mother–daughter dyads to isolate and quantify intergenerational impacts with different ranges of effects at both the product category and the product or brand level. Another seminal piece is the one by Algesheimer, Dholakia, and Herrmann (2005, p. 19) (148 in Fig. 3) who "develop and estimate a conceptual model of how different aspects of customers' relationships with the brand community influence their intentions and

behaviors. The authors describe how identification with the brand community leads to positive consequences, such as greater community engagement and negative consequences, such as normative community pressure and (ultimately) reactance".

This research stream also focuses on the connection between the consumer's identities and other consumers in relationships with brands. Brand communities strengthen consumer brand relationships (Stokburger-Sauer, 2010). A brand community is a self-selected group of consumers with a shared emotional attachment to a brand, shared values, and social identity, where consumers engage jointly to accomplish a common goal. A continuation of this research stream are papers focusing on consumer brand identification (Stokburger-Sauer, Ratneshwar, & Sen, 2013), online brand communities (Lee, Kim, & Kim, 2011; Zhou et al., 2012), social networks, and brand communities (Zaglia, 2013), as well as customer engagement and brand communities (Brodie, Ilic, Juric, & Hollebeek, 2013). More recently the brand community concept was adopted in research on accessed based consumption, like in the car sharing context (Bardhi & Eckhardt, 2012) or in the online consumption context (Lamberton & Rose, 2012). Therefore we propose that the concept of brand communities will continue to be in the focus of research interest.

### 5.5. Brand cult and brand relationships and culture

Research on brand cult and the influence of culture on brand relationships is closely related to both research streams 5.4 (Brand communities) and 5.6 (Self-brand-connections). Also culture related to consumption has been studied for decades (e.g. McCracken, 1986), only recent studies assess the influence of culture on consumer brand relationships or cross-cultural studies and consumer brand relationships (Chang & Chieng, 2006). Some studies focus on the relationship between consumer culture theory and consumer brand relationships (Arnould & Thompson, 2005; Nairn, Griffin, & Wicks, 2008; Thompson & Arsel, 2004) or cult (retro) brands (Brown, Kozinets, & Sherry, 2003). For example Chang and Chieng (2006, p. 927) (187 in Fig. 3) develop a framework of consumer brand relationships and conduct a cross-cultural comparative study of "consumers at coffee chain stores in Shanghai (China) and Taipei (Taiwan). The findings reveal that individual as well as shared experiences work through brand association, brand personality, brand attitude, and brand image to shape a consumer brand relationship". Thompson and Arsel (2004) (130 in Fig. 3) study the intersection of global brands and local cultures and develop the construct of the hegemonic brandscape. Later Arnould and Thompson (2005) (139 in Fig. 3) synthesize research conducted in the last two decades of consumer research addressing the sociocultural, experiential, symbolic, and ideological aspects of consumption. They assess the cultural dimensions of the consumption cycle with their brands and their brand relationships. Brown et al. (2003) (92 in Fig. 3) study cult (retro) brands. The authors conduct a 'netnographic' analysis of two prominent retro brands and show "the importance of Allegory (brand story), Aura (brand essence), Arcadia (idealized community), and Antinomy (brand paradox)" (Brown et al., 2003, p. 19). They also demonstrate that cult or retro brand management involves an occasionally clamorous relationship between producers and consumers.

This research stream focuses on cultural aspects of brand relationships as related to brands (cult brand) or related to social groups (culture). A continuation of this research stream are recent studies on cross cultural studies (e.g. Kim, Park, & Kim, 2014). We believe there is much more research needed to fully understand brand cult and specifically investigating the types, meaning and drivers of consumers' relationships to brands across various culture and sub-cultures.

### 5.6. Self-brand-connections

Some studies assess self-connection concepts and branding (Belk, 1988), and only recently has the concept of self-connection and consumer brand relationships been studied. There are multiple studies assessing the relationship between self-connection or related terms such as self-congruence, self-presentation, and reference group and their effect on consumer brand relationships. For example, Escalas and Bettman (2003, p. 339) (80 in Fig. 3) "focus on reference groups as a source of brand associations, which can be linked to one's mental representation of self to meet self-verification or self-enhancement goals. We conceptualize this in terms of self-brand connections, that is, the extent to which individuals have incorporated a brand into their self-concept". Later, Escalas and Bettman (2005, p. 378) (154 in Fig. 3) show that "consumers purchase brands in part to construct their self-concepts and, in doing so, form self-brand connections". Their results "show that brands with images consistent with an in-group enhance self-brand connections for all consumers, whereas brands with images that are consistent with an out-group have a stronger negative effect on independent versus interdependent consumers". Another key article in that research stream is the one from Chaplin and John (2005) (146 in Fig. 3) who assess self-brand connection for children and how these self-brand connections change from childhood to adolescence. Ji (2002) analyzes the relationships between children and brands. Nairn et al. (2008, p. 627) introduce a framework outlining the relationships children have with brands and "to understand the effects of brand symbols on the lives of today's children, including a more informed approach to socially responsible marketing".

Consumer brand relationship is interdisciplinary, complex and multi-dimensional. In that respect, as with the previous research streams they are all connected to each other. This stream of research on consumer's self-connections and brand relationships relates strongly to brand community (Section 5.4) in respect to brand identity as well as to brand cult (Section 5.5) as Fig. 3 also illustrates. Most recent works related to this are, among others, by Kressmann et al. (2006), Johnson, Matear, and Thomson (2011), Cheng, White, and Chaplin (2012), or Tuškej, Golob, and Podnar (2013). Research on the extended self (Belk, 1988) recently experienced a revival by Belk (2013) who adopted the concept to a digital world and thus revitalized this research stream.

### 5.7. Storytelling and brand relationships

As Fig. 3 illustrates, this research stream about consumer brand relationships and storytelling theory is currently not related to any other research stream. This is also obvious when looking at the publications which are mainly published in the journal of *Psychology & Marketing*. The work from Woodside and Chebat (2001) (32 in Fig. 3) updates Heider's (1958) balance theory in consumer behavior by linking it to theories of perceptual, attitudinal, and behavioral automaticity as well as controlled thinking between consumers and brands. They assess automatic-controlled memory retrievals and storytelling on thinking and action towards brands. Later, Woodside, Sood, and Miller (2008, p. 97) (243 in Fig. 3) show that "people relate to each other in terms of stories and products and brands often play both central and peripheral roles in their stories".

Albeit somehow a separate research stream as Fig. 3 illustrates, storytelling is a powerful way companies can use to communicate and strengthen the relationships consumers have with brands. It allows connecting consumers with brands and consumers like to buy lifestyles, emotions, legends, or myths. More recently, it looks like that some researchers have begun to borrow the concept of storytelling to other research streams identified in our bibliometric analysis such as storytelling and brand communities (Kuo & Feng, 2013; Megehee & Spake, 2012) but many other opportunities are available to further explore, how, where, when and why storytelling works or not for consumer brand relationships and subsequent research streams. For example, is

storytelling for consumer brand relationships culturally grounded or can storytelling be used to create brand heritage?

## 6. Discussion and limitations

The overall goal of this study was not only to shed light on the research area of consumer brand relationships but also to assess where the roots lie in academic literature and how this research field has evolved over the last decades. More in detail, we pursued three main research questions (RQ) which we want to recall hereinafter. Our work is based on a retrospective empirical analysis. We collected data from the *ISI Web of Science* database and conducted a bibliometric citation meta-analysis as this method has the power to uncover how consumer brand relationship research has evolved in the past (RQ1). Moreover, this technique allows uncovering which journals are the ones that spread CBR research in the literature and which articles and authors are the most cited ones (RQ2) and thus brought forward the research on consumer and their brands. Finally, our approach also revealed which universities respectively business schools have contributed most, and thus are what we call centers of excellence with regard to research on consumer brand relationships (RQ3).

The study here identified 392 articles, mostly from journals of business and management field followed by applied psychology, communications, hospitality, and also leisure, sports and tourism research. The results of the bibliometric analysis help in answering the first research question. Research on consumer brand relationships has many roots in the literature which meant that has developed not from a single source but from diverse sources, not only from consumer behavior research or the branding literature. Different disciplines conduct research about consumer brand relationships, which confirms its interdisciplinary nature, but still the discipline of management and business journals dominate. Specifically, the marketing literature with a focus on consumer research, like the *Journal of Consumer Research* or the peer-reviewed conference proceedings of the Association for Consumer Research (a.k.a. *Advances in Consumer Research*) as well as journals in the domain of marketing and psychology (e.g., *Psychology & Marketing*, *Journal of Consumer Psychology*), make a significant contribution. However, journals with a broader focus, like the *Journal of Marketing* or the *Journal of Business Research*, influence the development of consumer brand relationships demonstrably. However, the absence of publications regarding consumer brand relationship research in other highly regarded journals, like the *Journal of Applied Psychology*, *Journal of Consumer Affairs*, or *Journal of Personality & Social Psychology*, is surprising. This leads us to the conclusion that consumer brand relationship research has its roots primarily in the marketing literature.

The analysis uncovers that research on consumers and their brands evolved out of need considering that existing literature before the turn of the millennium neglected relationships between brands and consumers. Thus, literature in the late 1990s has simply been unable to explain specific phenomena of consumer behavior, like consumers' emotional attachment to brands (Thomson et al., 2005) or brand love (Ahuvia, 2005). Hence, driven from and based on existing literature on brand satisfaction and loyalty, brand personality, or brand meaning, just to name a few, academics started to investigate relationships between consumers and brands from a different perspective. Without any doubt Fournier's (1998) publication can be seen as a milestone, however not necessarily because of its groundbreaking framework but in particular, because of the tremendous popularity her seminal work gained in the scientific society.

No less important and also with regard to our second research question we identified those authors, and their articles, who are highly cited and thus are of relevance for consumer brand relationship research. In this regard, the outcome of the bibliometric analysis enables to highlight not only articles which are well-known in the literature but also a list of

trending papers which are up and coming (Table 4). We have provided detailed references on those ascending papers so that people can quickly assess if the topic might be relevant to their own research and consequently get inspiring ideas. In this regard, we visualized our findings using the citation mapping technique of the *HistCite™* software. This approach not only puts results into graphs (cf. Fig. 3) but also identifies seven sub-research streams related to consumer brand relationships: (1) The study of the relationships between various branding concepts such as brand loyalty, brand satisfaction, brand trust, brand commitment and brand personality; (2) effects of consumer brand relationships on consumer behavior and attitudes; (3) brand love; (4) brand communities; (5) brand cult and brand relationships and culture; (6) self-connection (e.g., self-congruence, self-presentation, reference group); and (7) storytelling theory.

In addition, the data reveal new insights into the global distribution of the most prolific authors and journals in this research area in terms of academic output, relevance and importance. The most influential institutions, respectively universities, are based in the USA and UK. This is not surprising as the majority of overall submission to international marketing journals is also dominated by Anglo-American contributions. However, our bibliometric analysis reveals those universities that conducted research in consumer brand relationships from the very start, as shown in Table 1.

This bibliometric analysis makes an important contribution to the literature, as it outlines, structures, and identifies the key institutions, journals, articles and authors as well as research streams in linkage to the research about consumer brand relationships. However, some limitations are noteworthy in this study. While our dataset from *ISI Web of Science* is comprehensive, it is not exhaustive. Even though the top tier marketing journals are included in our study our analysis did not include all journals available worldwide as well as all conference proceedings like the ones from the *American Marketing Association* (AMA), the *Academy of Marketing Science* (AMS) or from the *European Marketing Academy* (EMAC). Also they have been taken into account in our global citations as cited articles, they have not been included as possible key articles. Therefore, our results are valid within that scope. Our study does not exclude self-citations from the analysis. Although this practice is common, future research may find a way to operate and exclude self-citations to yield a more accurate assessment of an article's importance.

Despite its high degree of objectivity, bibliometric citation meta-analysis is subjective since we had to make choices on the time period and terms used, as well as identifying and labelling the core research streams. The articles reviewed here were all written in English. Future research should investigate non-English research and highlight their contribution to this research field. Another limitation is that our bibliometric analysis is based on papers which have been published and cited by other articles. As this might take some time, we are aware that current "hot topics" related to consumer brand relationships such as anthropomorphism and brand relationships (Aggarwal & McGill, 2012), brand divorce (Fiona, Meamber, & Hall, 2012), brand authenticity (Bruhn, Schoenmüller, Schäfer, & Heinrich, 2012), and others were not identified as key research streams. We believe these are important and emerging research topics to consider and are an integrated part of the consumer brand relationship research field. Nevertheless, the results of our analysis shed light on a relatively new and fascinating research area of the relationships between consumers and brands. While academia and practitioners have paid huge attention to customer relationship management (CRM) in the past, consumer brand relationships management (CBRM) is still in its infancy. Hence, it is not surprising that the number of top tier quality publications and journals issuing with this topic is still not vast but constantly growing. Therefore we like to encourage academics worldwide to devote themselves to the trendsetting field of consumer brand relationship research.

## Appendix A

## A.1 Journal related abbreviations

Abbreviation	Explanation
ACR	Advances in Consumer Research
CMR	California Management Review
EJM	European Journal of Marketing
IJMR	International Journal of Marketing Research
IMM	Industrial Marketing Management
IMR	International Marketing Review
JA	Journal of Advertising
